# **Problem C. Greg and Array**

**Time limit** 1500 ms **Mem limit** 262144 kB

Greg has an array  $a=a_1, a_2, ..., a_n$  and m operations. Each operation looks as:  $l_i, r_i, d_i$ ,  $(1 \le l_i \le r_i \le n)$ . To apply operation i to the array means to increase all array elements with numbers  $l_i, l_i + 1, ..., r_i$  by value  $d_i$ .

Greg wrote down k queries on a piece of paper. Each query has the following form:  $x_i, y_i$ ,  $(1 \le x_i \le y_i \le m)$ . That means that one should apply operations with numbers  $x_i, x_i + 1, ..., y_i$  to the array.

Now Greg is wondering, what the array *a* will be after all the queries are executed. Help Greg.

#### Input

The first line contains integers n, m, k ( $1 \le n$ , m,  $k \le 10^5$ ). The second line contains n integers:  $a_1, a_2, ..., a_n$  ( $0 \le a_i \le 10^5$ ) — the initial array.

Next m lines contain operations, the operation number i is written as three integers:  $l_i$ ,  $r_i$ ,  $d_i$ ,  $(1 \le l_i \le r_i \le n)$ ,  $(0 \le d_i \le 10^5)$ .

Next k lines contain the queries, the query number i is written as two integers:  $x_i, y_i$ ,  $(1 \le x_i \le y_i \le m)$ .

The numbers in the lines are separated by single spaces.

#### Output

On a single line print n integers  $a_1, a_2, ..., a_n$  — the array after executing all the queries. Separate the printed numbers by spaces.

Please, do not use the %11d specifier to read or write 64-bit integers in C++. It is preferred to use the cin, cout streams of the %164d specifier.
